UI AND UX - ASSIGNMENT

Introduction

UI and UX are important concepts in the field of web and app development. They help create applications that are both attractive and comfortable for users.

Understanding UI

UI (User Interface) refers to the visual part of an application that people see on their screens. It includes the design, colours, buttons, icons, and overall appearance.

Understanding UX

UX (User Experience) describes how a person feels while using an application. It focuses on making the app simple, useful, and easy to navigate.

Key Differences

UI is mainly concerned with the look and

design of an application.
UX focuses on the user's overall experience.
UI makes an app visually appealing.
UX makes an app convenient and easy to operate.
Example from Daily Life

Consider a food delivery application. Its attractive design, food pictures, and colourful buttons are part of UI. The ability to search for food, place orders easily, and track deliveries comes under UX.

Final Thoughts

Although UI and UX are different, they depend on each other. A good-looking application may attract users, but a smooth and simple experience encourages them to keep using it. Therefore, both are necessary for successful app design.
